With countless cyber security tools available today, there are challenges in choosing the correct solutions for your organization. Trace3 helps you identify the right security tools by analyzing your current security architecture and providing you with suggestions for improvement.

Identifying the Right Security Tool

There are hundreds of cyber security tools in the market today. Many tools promise more than they deliver and don't integrate well with other tools. If a tool does not integrate with a centralized monitoring system and its purpose and benefits are not clear, it will quickly become obsolete.

With a multitude of tools available:
- How do you know if you have the right ones?
- Did you deploy and configure the tool correctly?
- Are you using the tool properly and to its fullest potential?
- Are you missing anything important?

Organizations are searching for an integrated security architecture, one that relies on complementary solutions that work together rather than decentralized solutions. It is essential to have clearly defined business outcomes when making the shift toward security transformation.

What to Expect

Security tools must be re-evaluated against industry standards to ensure your investment is producing the right outcomes for your organization. Trace3 will evaluate which tools are working, obsolete tools that can be decommissioned, and security gaps within your infrastructure. We'll also work with you to develop a customized list of recommendations and next steps to improve your organization's security posture.

INNOVATIVE SOLUTIONS + ELITE CONSULTING SERVICES = EFFECTIVE SECURITY OUTCOMES
