Your business relies on technology infrastructure to keep running, but the threat of malicious software attacks has forced IT departments to be more proactive in protecting their technology environment.

Trace3 knows the most effective way to protect against security threats is to ensure that every machine has the latest software patches installed. One unpatched server can threaten the stability of your entire network. Trace3’s Patching as a Service (PaaS) is customized to fit your environment and prevent against vulnerabilities on-premise, in the cloud, with third party applications, or within a hybrid infrastructure.

Your Time is Valuable.
The manpower needed to deploy a successful patching process can be resource-consuming. Patching as a Service allows your team to spend less time on chores, like maintaining patches, and focus on things that are important, like growing your business. Trace3 can even schedule patching during non-critical hours, so your business can continue without interruption.

We’ve Got Your Back
Unpatched systems are incredibly risky, but because PaaS is scheduled and ongoing it becomes part of your standard business processes. This ensures your systems are up-to-date with the latest software. And, since the Trace3 Network Operations Center runs 24x7x365, we’re always available when you need us.

Control the Experience
A fixed monthly investment can help you more accurately predict the cost of maintaining your environment. By building PaaS into your monthly budget, you can greatly reduce the need for staff increases or costly emergency engagements. This keeps your team focused on core business innovation, not routine maintenance.

Compliance Reporting
Monthly security and compliance reports are delivered as part of the service. For more information, or to schedule an assessment of your environment, contact us at 888.264.2363 or gems@trace3.com.
